Concepts of Automata Theory

Three basic concepts

- Alphabet** a set of symbols
- Strings** a list of symbols from an alphabet
- Language** a set of strings from the same alphabet

Concepts of Automata Theory

Alphabets:

A common way to talk about words, number, pairs of words, etc. is by representing them as **strings**. To define strings, we start with an **alphabet**

Concepts of Automata Theory

Alphabets:

Definition: An alphabet is a finite, nonempty set of symbols. Conventional notation, S .

The term "symbol" is usually not defined.

Example:

$\Sigma_1 = \{a, b, c, d, \dots, z\}$: the set of letters in English

$\Sigma_2 = \{0, 1, \dots, 9\}$: the set of (base 10) digits

$\Sigma_3 = \{a, b, \dots, z, \#\}$: the set of letters plus the special symbol #

$\Sigma_4 = \{ (,) \}$: the set of open and closed brackets

Concepts of Automata Theory

Strings:

Definition: A **string** (or word) is a finite sequence of symbols from some alphabet.

Example - 1011 is a string from alphabet $\Sigma = \{0, 1\}$

• **Empty string ϵ** - a string with zero occurrences of symbols

• **Length $|w|$** of string w - the number of **positions** for symbols in w

Examples - $|0111|=4, |\epsilon|=0\dots$

Set of all strings over S --- denoted as S^* . It is not difficult to know that $S^* = S^0 \cup S^1 \cup S^2 \cup \dots$

Concepts of Automata Theory

Strings:

Example: A **string** (or word) is a finite sequence of symbols from some alphabet.

abfbz is a string over $\Sigma_1 = \{a, b, c, d, \dots, z\}$

9021 is a string over $\Sigma_2 = \{0, 1, \dots, 9\}$

ab#bc is a string over $\Sigma_3 = \{a, b, \dots, z, \#\}$

))0(0 is a string over $\Sigma_4 = \{ (,) \}$

Concepts of Automata Theory

Languages:

Definition: A language is a set of strings all chosen from some S^* .

If Σ is an alphabet, and $L \subseteq \Sigma^*$, then L is a language over Σ .

Examples:

- The set of all legal English **words** is a language. Why? What is the alphabet here? **Answer: the set of all letters**
- A legal program of C is a language. Why? What is the alphabet here? **Answer: a subset of the ASCII characters**

Languages

Languages can be used to describe problems with “yes/no” answers, for example:

- L1 = The set of all strings over S1 that contain the substring “fool”
- L2 = The set of all strings over S2 that are divisible by 7
= {7, 14, 21, ...}
- L3 = The set of all strings of the form s#s where s is any string over {a, b, ..., z}
- L4 = The set of all strings over S4 where every (can be matched with a subsequent)

Concepts of Automata Theory

Languages:

Examples:

The set of all strings of n 0's followed by n 1's for $n \geq 0$:

{ ϵ , 01, 0011, 000111, ...}

- Σ^* is an **infinite** language for any alphabet.
- ϕ = the **empty language** (not the empty string ϵ) is a language over any alphabet.
- $\{\epsilon\}$ is a language over any alphabet (consisting of only one string, the empty string ϵ).

Concepts of Automata Theory

Languages:

Ways to describe languages:

Description by **exhaustive listing**

- L1 = {a, ab, abc} (finite language; listed one by one)
- L2 = {a, ab, abb, abbb, ...} (infinite language; listed partially)
- L3 = $L(ab^*)$ (infinite language; expressed by a regular expression)

Chapter 1 - 10

Concepts of Automata Theory

Languages:

Ways to describe languages:

Description by **generic elements**

L4 = {x | x is over $V = \{a, b\}$, begins with a, followed by any number of b, possible none}

(note: L4 = L3 = L2)

Description by **integer parameters**

L5 = {ab n | $n \geq 0$ }

(note: L5=L4=L3=L2)

Chapter 1 - 11

Concepts of Automata Theory

Operations on Languages:

Languages are sets, and operations of sets may be applied to them:

- (1) **union** - $A \cup B = \{a \mid a \in A \text{ or } a \in B\}$
- (2) **intersection** - $A \cap B = \{a \mid a \in A \text{ and } a \in B\}$
- (3) **difference** - $A - B = \{a \mid a \in A \text{ and } a \notin B\}$
- (4) **product** - $A \times B = \{(a, b) \mid a \in A \text{ and } b \in B\}$
- (5) **complement** - $\bar{A} = \{a \mid a \in U \text{ and } a \notin A\}$
- (6) **power set** - $2^A = \{B \mid B \subseteq A\}$

U is the **universal set**, like an alphabet for sets of symbols

Concepts of Automata Theory

Operations on Languages:

The usual set operations

$$\{a, ab, aaaa\} \cup \{bb, ab\} = \{a, ab, bb, aaaa\}$$

$$\{a, ab, aaaa\} \cap \{bb, ab\} = \{ab\}$$

$$\{a, ab, aaaa\} - \{bb, ab\} = \{a, aaaa\}$$

Complement: $\bar{L} = \Sigma^* - L$

$$\overline{\{a, ba\}} = \{\lambda, b, aa, ab, bb, aaaa, \dots\}$$

Costas Busch - RPI

13

Concepts of Automata Theory

Operations on Languages:

Reverse:

$$L^R = \{w^R : w \in L\}$$

Definition:

$$\{ab, aab, baba\}^R = \{ba, baa, abab\}$$

Examples:

$$L = \{a^n b^n : n \geq 0\}$$

$$L^R = \{b^n a^n : n \geq 0\}$$

Costas Busch - RPI

14

Concepts of Automata Theory

Operations on Languages:

Concatenation:

$$\text{Definition: } L_1 L_2 = \{xy : x \in L_1, y \in L_2\}$$

$$\{a, ab, ba\} \{b, aa\}$$

Example:

$$= \{ab, aaa, abb, abaa, bab, baaa\}$$

Costas Busch - RPI

15

Concepts of Automata Theory

Operations on Languages:

Star-Closure (Kleene *):

$$\text{Definition: } L^* = L^0 \cup L^1 \cup L^2 \dots$$

Example:

$$\{a, bb\}^* = \left\{ \begin{array}{l} \lambda, \\ a, bb, \\ aa, abb, bba, bbbb, \\ aaa, aabb, abba, abbbb, \dots \end{array} \right\}$$

Costas Busch - RPI

16

Concepts of Automata Theory

Operations on Languages:

Positive Closure:

$$\text{Definition: } L^+ = L^1 \cup L^2 \cup \dots$$

$$= L^* - \{\lambda\}$$

$$\{a, bb\}^+ = \left\{ \begin{array}{l} a, bb, \\ aa, abb, bba, bbbb, \\ aaa, aabb, abba, abbbb, \dots \end{array} \right\}$$

Costas Busch - RPI
